Good Morning Year 3!

Some feedback from the Maths lesson on Thursday...
Remember that an angle is the distance between two **straight** lines that join up.

Why isn't there an angle in these two examples?

What is a right angle?

A right angle is the distance between two straight lines that are joined up and it is always measured at 90°.

This square tells us that this is a right angle as the distance between the two lines that are joined up is 90°. We can also draw this to show that the distance between the two lines is 90°.
True or false?

All of these shapes have at least one right angle...
True!
All of these shapes have at least one right angle...

How many right angles does each shape have?

4   1   4

Over to you!

The worksheets that you need to complete the task is on Google Classrooms.

Load and print the sheets out. Once you have completed your work, submit your work!

Any questions?

If there are any problems, just send a message to me.

Good luck! :)
